

# Brief Instructions for Anti CANT Scope Mount Ring

## General Feature

100% avoid CANT, Accurate to within 1/8 of a degree

30mm Diameter

Full metal

Easy-to-use without special tool, no gun smith needed

Can mount each side of the scope, close to objective lens or ocular lens

Properly mounted, this mount allows the shooter to visualize and make adjustments for CANT, which experienced shooters recognize as rotation of a scope's crosshairs off a true vertical/horizontal plane. Shooting success is then a simple matter of patience and good technique.

The ACD mount is an inexpensive scope accessory for shooting. It is typically installed to the scope body between the eyepiece and the rear scope ring, or in any position where it can be visualized by the non-sighting eye. Alignment is made using a known perpendicular reference. With the ACD mount in place, the shooter can rely on his non-sighting eye to visualize CANT and compensates by locating the bubble in relation to the level's reference lines.
